2014 Crop Results

Vitazyme on Peanuts

Researcher: Rock Lubin
Research organization: Acra Industries, Haiti
Location: Boucan Carre, Haiti
Variety: unknown
Planting date: unknown

Experimental design: This experiment was part of a multi-crop testing program that was established in December of 2011, to evaluate the efficacy of Vitazyme for increasing crop yields in Haiti. The test area was 1 hectare (10,000 m²) for the treated and control plots.

1. Control
2. Vitazyme

Fertilization: unknown
Vitazyme application: 1 liter/ha (13 oz/acre)
Harvest date: unknown

Yield results:

Increase in peanut yield with Vitazyme: 100%

Conclusions: A peanut study in Haiti revealed a great increase in yield with Vitazyme application, a doubling of the yield versus the untreated control. This program is shown to hold great promise in helping to alleviate food production problems in this developing country.

2006 Crop Results

Vitazyme on Peanuts
Ministry of Sugar, Cuban Ministry of Agriculture

Researchers: Wilberto G. Marrero and Jorge G. Acosta
Location: Pedro Gonzalez Credit and Service Cooperative, Havana Province, Cuba
Soil type: red ferralitic (Eutrustoxy) of low fertility
Planting rate: unknown
Planting date: June 6, 2006
Experimental design: A field was split with one part treated with Vitazyme and the other portion left untreated. The objective of the study was to discover the effect of Vitazyme on peanut yield.

1. Control
2. Vitazyme

Fertilization: unknown
Vitazyme application: 1 liter/ha on June 21, 15 days after planting; 1 liter/ha on July 17, 31 days after planting

Growth observations:

Increase in peanut yield: 93%

Conclusions: In this Cuban peanut study conducted on red ferralitic soils, two applications of Vitazyme at 1 liter/ha each time greatly increased the yield of peanuts (+93%) above the control and also over the historical yield average.
2005 Crop Results

Vitazyme on Peanuts

**Researcher/Farmer:** George Nickelson  
**Location:** Whitheral, Texas  
**Variety:** TamSpan 90  
**Row spacing:** 40 inches to middles, 8 inches on berm  
**Population:** 100 lb/acre  
**Soil type:** medium sandy loam  
**Planting date:** May 15, 2004  
**Previous crop:** cotton  

**Experimental design:** A center-pivot field was divided into two 33.5-acre areas, with one part receiving Vitazyme and the other no product. All other treatments were the same for both areas.

1. Control  
2. Vitazyme

**Fertilizer:** 11-52-0% N-P₂O₅-K₂O applied pre-plant, with some liquid calcium and nitrogen applied through the irrigation system

**Vitazyme application:** 13 oz/acre at planting, sprayed on the soil in a 10-inch band behind the planter; 13 oz/acre sprayed on the leaves and soil at early bloom

**Irrigation:** about one inch per week during the primary growing period

**Weather:** a fairly cool summer with good rainfall all year

**Harvest date:** dug in early October, and picked up November 1 to 6

**Yield results:** Results were affected by excessive weed growth from considerable rainfall, the Vitazyme area more so because it was on the outside of the circle. The Vitazyme area was also lower, on part of an old lake bottom.

<table>

<td>3,329 lb/acre</td>
<td>—</td>
</tr>
<tr>
<td>Vitazyme</td>
<td>3,521 lb/acre</td>
<td>+192 (+6%)</td>
</tr>
</tbody>
</table>

**Yield increase:** 6%

**Quality and income results:** Based on payment reports, the average prices for the peanuts were as follows:

- Control: $0.1861/lb, or $372.20/ton
- Vitazyme: $0.1869/lb, or $373.80/ton

</tr>
<tr>
<td>Vitazyme*</td>
<td>3,521</td>
<td>658.07</td>
<td>38.54</td>
</tr>
</tbody>
</table>

*See the prices above.

**Conclusions:** This west Texas field-scale peanut study revealed that Vitazyme produced a small (6%) but highly profitable yield increase, which was of slightly higher quality and produced $38.54/acre more income. This increase came despite the Vitazyme treatment having a more serious weed problem than the control, and being located on an old lake bed which, during this wet year, hindered maximum yields.
2003 Crop Results

Vitazyme on Peanuts

**Farmer:** George Nickelson  
**Variety:** TamSpan 90  
**Soil type:** medium sandy loam  
**Previous crop:** cotton  
**Location:** Whitheral, Texas  
**Row spacing:** 40 inches to middles, 8 inches on berm  
**Population:** 100 lb/acre  
**Planting date:** May 15, 2003

**Experimental design:** A center pivot field was divided into two 33.5-acre areas, one receiving Vitazyme and the other none. All other treatments were the same for both parcels.

1. **Control**  
2. **Vitazyme**

**Fertilizers:** 11-52-0 fertilizer applied preplant  
**Vitazyme application:** 13 oz/acre at planting, 13 oz/acre about July 20 on the leaves and soil  
**Irrigation:** as needed, but one period of about 2 weeks received none due to the loss of the irrigation rig from a tornado.

**Weather:** a hot, extremely dry summer; 8.5 inches of rain for the year, with no rain for August and September  
**Harvest date:** November 18, 2003 (dug several weeks earlier)

**Yield results:**

<table>
<thead>
<tr>
<th>Treatment</th>
<th>Yield</th>
<th>Change</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Control</td>
<td>3,515</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Vitazyme</td>
<td>3,582</td>
<td>67 (+2%)</td>
<td></td>
</tr>
</tbody>
</table>

**Yield increase:** 2%

**Income results:** The sale price of the peanuts was $370/ton, or $0.185/lb.

67 lb/acre x $0.185/lb = $12.40/acre more income from Vitazyme

**Conclusions:** This peanut trial in west Texas produced a small but profitable yield increase with Vitazyme application. The peanut grade was similar for both treatments (about 77). The yield difference would have been greater if the treated areas had not included low areas that produced less yield due to more weed competition and poorer water relations. In 2002, a similar test on this same farm with peanuts produced a 30% yield increase with Vitazyme.

Vitazyme on Peanuts

**Farmer**: George Nickelson, Jr.  
**Location**: Whitherral, Texas  
**Row spacing**: 40 inches, double row with 8 in spacing  
**Variety**: Spanish, “Tam-Span 90”  
**Planting date**: May 18, 2002  
**Soil type**: fine sandy loam  
**Harvest date**: dug October 21, picked up about November 15  
**Experimental design**: A center pivot area was divided into halves, one half treated with Vitazyme and the other half left untreated.

**Fertilization**: 20 lb/acre N preplant, 11-50-0 postplant  
**Vitazyme application**: 13 oz/acre June 18, on the leaves and soil  
**Seed inoculation**: all seeds inoculated with rhizobium bacteria at planting

**Yield results**

<table>
<thead>
<tr>
<th>Treatment</th>
<th>Total for 33 acres</th>
<th>Area yield</th>
<th>Yield change</th>

<td></td>
</tr>
<tr>
<td>Vitazyme</td>
<td>157,398</td>
<td>4,770</td>
<td>+1,089 (+30%)</td>
</tr>
</tbody>
</table>

**Yield increase**: 30%

**Quality results**: All of the peanuts graded at 77, a very high grade.  
**Income results**: A price of $382/ton was received for the peanuts.

**Increase in income with Vitazyme**: $208.00/acre  
**Cost:Benefit ratio of Vitazyme**: 52:1

**Quality observations**: Peanuts that were collected from both treatments on August 21, and stored in plastic bags, revealed that the control peanuts developed a coating of white fungus over all pod surfaces; the Vitazyme treated peanuts developed very little fungus coating. This difference may imply the ability of Vitazyme to help the peanut plant deter fungal diseases.

**Conclusions**: One application of Vitazyme on the irrigated peanut field increased the yield by 30%, giving a very high return ratio of 52:1, which translated to an increase of $208/acre. This great increase in yield and return with Vitazyme is likely due in part to the synergism of Vitazyme’s active agents with the rhizobium bacteria in the rhizosphere to encourage natural symbiotic nitrogen fixation.

1998 Crop Results

Vitazyme on Peanuts
Caribbean Agricultural Research and Development Institute (CARDI)

Researcher: Leslie Simpson, Ph.D.  Location: Ebini region, Guyana
Seeding date: unknown  Variety: AK62
Seeding rate: unknown  Row spacing: unknown
Experimental design: A randomized complete block design with four replications was established on a uniform soil area. Each plot was 2.7X10.0 meters (0.0027 ha). Treatments were as follows:
  1. Control (no Vitazyme)
  2. Vitazyme applied twice
  3. Vitazyme applied once
Fertility treatments: unknown
Vitazyme applications: For Treatment 2, Vitazyme was applied at 1 liter/ha (13 oz/acre) to the soil after planting but before emergence, and at the same rate at pegging. For Treatment 3, only the pegging treatment was applied.
Harvest date: unknown
Yield results: Several parameters were determined at harvest, as indicated below.

</tr>
</tbody>
</table>

*Significantly greater than the control at P=0.14; **significantly greater than the control at P=0.01. LSD_{0.10}=0.74; LSD_{0.01}=1.29.

**Yield increase: 21%**

**Comments:** Vitazyme applied to peanuts at the initiation of pegging greatly and significantly stimulated peanut growth and yield (by 21%). Peg fresh and dry weights were improved by two applications of Vitazyme, but the yield effect showed through primarily with a single 1 liter/ha (13 oz/acre) application at pegging. Plant height was negatively correlated with yield. It appears that one application of Vitazyme at pegging may be sufficient in this tropical environment to elicit the maximum yield potential of peanuts.
1997 Crop Results

Vitazyme on Organic Peanuts

— Irrigated —

**Researcher:** Cliff Bingham  
**Location:** Brownfield, Texas  
**Seeding rate:** 57 lb/acre  
**Row width:** 40 inches  
**Variety:** Valencia  
**Experimental design:** A production field was divided into two sections: an untreated control and a Vitazyme treated area. A live *Rhizobium* seed inoculant was added on the seed along with Vitazyme.

1. Control (no Vitazyme)  
2. Vitazyme plus *Rhizobium*

**Fertility treatments:** manure at 10 tons/acre, applied in February of 1996  
**Vitazyme application:** 13 oz/acre on the seed at planting, along with a live *Rhizobium* inoculant; 10 oz/acre sprayed on the foliage and soil at early bloom  
**Soil:** Brownfield sandy loam  
**Weed control:** cultivation  
**Harvest date:** Vitazyme treatment: dug on September 18 and 19, and threshed September 25. Control treatment: dug on September 30, and threshed October 5  
**Yield results:**

<table>
<thead>
<tr>
<th>Payout</th>
<th>Control</th>
<th>Vitazyme</th>
<th>Increase with Vitazyme</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peanut weight</td>
<td>2.981 lb/acre</td>
<td>3.155 lb/acre</td>
<td>174 lb/acre</td>
</tr>
</tbody>
</table>

*Yield Increase: 6%*

*Note: This yield increase should have been higher due to a breakdown of the irrigation system, resulting in less water delivered to the Vitazyme rows later in the season.*

**Income results:** The price paid for the Vitazyme-treated peanuts was $0.225/lb, and $0.219/lb for the control peanuts. The reduced price for the control was in part due to greater shelling caused by excessive drying of the peanuts before threshing.

<table>
<thead>
<tr>
<th>Payout</th>
<th>Control</th>
<th>Vitazyme</th>
</tr>
</thead>
<tbody>
<tr>
<td>Peanut income</td>
<td>$652.84/acre</td>
<td>$709.88/acre</td>
</tr>
</tbody>
</table>

*Income Increase: $57.04/acre*

**Comments:** The Vitazyme treated peanuts had much better growth and a darker green color than the control throughout the season. The Vitazyme and *Rhizobium* effects are unable to be determined individually by this test.
