Researchers: Agustin Peralta, Modesto Sánchez, and Israel Calva
Farmer: Modesto Sánchez
Research organization: Quimica Lucava
Location: La Purisima Hidalgo, Municipality of Tochtepec, Puebla, Mexico
Variety: Seminis 8551
Experimental design: A dry bean field that was injured by hail was treated on 70 rows with Vitazyme at 1 liter/ha. The purpose of the study was to evaluate the ability of the product to influence bean yield after hail damage compared to the untreated control.

Harvest date: October 20, 2014

Yield results:

Increase in bean yield with Vitazyme: 5%

Income results: At a price of 0.60 USD/kg, increase in dry bean income with Vitazyme: 105 USD/ha, with a single, 1 L/ha Vitazyme application (cost 32 USD/ha, including labor) for a net profit of 73 USD/ha.

Conclusion: This dry bean study in Mexico showed that Vitazyme is able to aid in the rapid recovery of bean plants from hail damage. The yield was increased by 5%, with extra income of 105 USD/ha and a net profit of 73 USD/ha with a single application. The plants were less stressed than in the control areas, having more flowers and pods, and fewer insect pests.
Researchers: Pierrot Maei and Valdimir Vincent
Location: Croix des Missions, Haiti
Planting date: unknown
Experimental design: This experiment was part of a multi-crop testing program that was established in December of 2011, to evaluate the efficacy of Vitazyme for increasing crop yields in Haiti. The test area was 1 hectare (10,000 m²) for the treated and control plots.

1. Control
2. Vitazyme

Fertilization: unknown
Vitazyme application: 1 liter/ha (13 oz/acre)
Harvest date: unknown

**Conclusions:** A dry bean study in Haiti revealed a great increase in yield with Vitazyme application, the yield more than doubling in this trial. This program is shown to hold great promise in helping to alleviate food production problems in this developing country.
Researchers: Jorge Gonzalez Acosta and Wilberto Gonzalez Marrero
Organization: Ministry of Sugar, Camilo Cienfuegos Agricultural Enterprise
Location: Pedro Gonzalez Farm, Havana Province, Cuba
Variety: unknown
Watering: rainfed
Planting date: October 15, 2006
Soil type: unknown
Experimental design: A 1.86 hectare field was divided, and one part was treated with two applications of Vitazyme to evaluate its capability to increase yields.

1. Control
2. Vitazyme

Fertilization: according to recommendations

Vitazyme application: 1 liter/ha on November 5, 2007 (20 days after planting), and another 1 liter/ha on December 30, 2006, 54 days later

Growing season observations: The Vitazyme treatment was noted to have the following benefits versus the control:

• More than 17 pods/plant, which was greater than the control
• More beans/pod
• Greater stalk vigor and diameter
• More rapid plant growth
• A greater number of leaves

Harvest date: February 15, 2007

Yield results:

Increase in bean yield: 61%

Conclusions: This Cuban dry bean study showed the great capability of Vitazyme to improve dry bean yield (+61%). Compared to both the control and the historical average yield, the growth of the plants and their yield were markedly improved. This simple, inexpensive treatment yields excellent economic returns for not only dry beans, but for all crops with which it is used in Cuba.

</table>

Fertilization: unknown
Vitazyme application: 1 liter/ha at 10, 30, and/or 40 days (at flowering) after planting using backpack sprayers
Harvest date: unknown
Yield results: Harvesting was completed manually and the beans were weighed for each plot.

Bean yield increase

- Vitazyme 10 days after planting: +29%
- Vitazyme 10 and 30 days after planting: +50%
- Vitazyme 10, 30, and 40 days after planting: +75%
- Vitazyme 40 days after planting: +54%

All Vitazyme treatments increased bean yield, up to 75% above the control, although the only fair comparisons are Treatments 1 and 2 with the control (Treatment 5), which grew red beans. The two black bean treatments produced 25% more yield than did the two red bean treatments.
**Growth observations:** Leaf and stem growth were the best with all Vitazyme treatments compared to the control, and Treatments 3 and 4 (three applications, and one application at flowering, respectively) produced the most pods out of the five treatments.

**Income results:**

</table>

1. Based on a 15.214 pesos/kg price.
2. Based on a cost of 11.72 pesos/liter of Vitazyme, and a 20.07 pesos/ha application cost.

**Increase in profit with vitazyme:** 2,208.3 to 5,784.7 pesos/ha

**Conclusions:** Vitazyme in all applications substantially increased the yield of dry beans in Cuba during this study, the best treatment being three applications at 10, 30, and 40 days after planting (a 75% yield increase). This yield gave rise to an additional 5,784.7 pesos/acre above the control. The single 1 liter/ha rate at blossom gave the greatest return per invested peso. According to the researchers,

1. Vitazyme, applied at 1 liter/ha over the foliage and moist soil, increased dry bean yield as compared to the untreated control, regardless of the number of applications.
2. The profits, revenues, or returns per invested peso in product and application cost was greater when only one Vitazyme application was made at the beginning of the flowering stage.
Researchers: Eng. Wilberto Gonzalez, and Eng. Jorge Gonzalez, Camilo Cienfuegos Agricultural Enterprise
Location: Camilo Farm and Victoria de Giron Farm of Camilo Cienfuegos Agricultural Enterprise, Havana Province, Cuba
Variety: black dry beans
Soil type: red ferralitic
Planting date: late 2005 to early 2006
Experimental design: A commercial production trial involved a split field of 2.0 ha treated and 1.0 ha not treated with Vitazyme at Victoria de Giron Farm, and 1.0 ha treated and 1.0 ha not treated at Camilo Farm.

1. Control
2. Vitazyme

Fertilization: unknown
Vitazyme applications: 1.0 liter/ha sprayed over the soil and leaves two times, separated by 30 days

Yield results:

**Victoria de Giron Farm**

- **Control**: 0.85 tons/ha
- **Vitazyme**: 2.20 tons/ha

Increase in bean yield: 159%

**Camilo Farm**

- **Control**: 0.78 tons/ha
- **Vitazyme**: 1.10 tons/ha

Increase in bean yield: 41%

Conclusions: Vitazyme applied twice during the growing cycle in this commercial Cuban bean study revealed excellent yield increases, of 159 and 41%.

</table>

Increase in bean yield: 104%

Conclusions: This black bean split-field trial in Cuba revealed that Vitazyme, applied twice at 1 liter/ha each time, greatly boosted the bean yield, by 104% over the control and by 39% above the historical average yield for that area and management system. These increases occurred in spite of the year being very dry. According to the research report, “This Vitazyme treatment experienced conditions of extreme drought and results have been satisfactory, being able to produce the seeds for the next planting

1Significant difference at P=0.01 (SE± 0.01 cm); 2significant difference at P=0.01 (SE±0.05 beans); 3significant difference at P=0.01 (SE±1.15%); 4significant difference at P=0.01 (SE±9.03 kg/ha).

**Conclusions:** [Report of the Cuban researcher:] “This trial was carried out under adverse conditions, since after planting other field operations (irrigation, fertilization, pesticides, and cultivation) were not implemented. Under these conditions Vitazyme application showed positive effects on bean yield.”

“In spite [of the fact] that the area did not receive cultural attention and Vitazyme was applied before flowering:

- There was greater pod length and number of beans, as well as [a] smaller number of malformed beans when Vitazyme was applied.
- Yield increased by 24.73% when Vitazyme was applied.
- Under adverse trial conditions (no irrigation, fertilization, and pesticides) Vitazyme showed positive effects.”

“It is recommended to carry out new trials under actual crop production conditions.”

Vitazyme on Black Beans
Vegetable Study by the Cuban Tobacco Institute

Researcher: unknown Location: near Havana, Cuba Variety: unknown Soil type: unknown
Planting rate: unknown Planting date: unknown Seeding rate: unknown
Experimental design: A field of black beans was treated with Vitazyme except for one portion of the field, the purpose of the test being to discover possible positive effects of this biostimulant on black bean production.

1. Control
2. Vitazyme

Fertilization: unknown
Vitazyme application: 1 liter/ha (13oz/acre) at flower initiation
Growth effects: At an unknown date various growth parameters were measured. Ten average plants were measured for each parameter.

Increase in ...
- weight/plant: + 20%
- pods/plant: + 17%
- seeds/plant: + 22%
- seeds/pod: + 2%
- yield/plant: + 22%

Conclusions: Vitazyme applied only one time to black beans in this Cuban test caused about 20% increases in plant growth (weight, pods, seeds, and yield per plant), while the seeds per pod were nearly the same for both treatments. Vitazyme is shown to be an excellent amendment to increase black bean yield in Cuba.

</tr>
</tbody>
</table>
Conclusions: Vitazyme applied to Navy beans in this Red River Valley test revealed that a single June applica­tion, applied with MgSO₄ and a fungicide, greatly increased the bean yield (+38%) and reduced the number of split beans. This effect was due to a triggering of photosynthesis and enhanced rhizosphere activity... and thus an increase in nutrient uptake, carbon fixation, and bean development. A greater deposition of cellulose and lignin in cell walls likely strengthened the seed coat to reduce seed splitting. The yield increase boosted income by $105.48/acre over the control treatment.

**Income increase with Vitazyme (2X):** $68.64/acre

**Cost:Benefit ratio of Vitazyme use (2X):** 8.6:1

**Conclusions:** Vitazyme applied once (preplant incorporated) in this Navy bean test in the Red River Valley of the North did not increase bean yield, but rather slightly decreased yield. This decrease was due to early season heavy rains, upon compacted soils, which reduced soil air and damaged roots and rhizosphere activity, thus inhibiting Vitazyme’s action. On the other hand, this preplant application plus a July foliar application greatly increased bean yield (+26%) while also decreasing the number of split beans (2.8% vs. 6.0% for the control). **This yield and quality increase was due to Vitazyme’s ability to stimulate photosynthesis and rhizosphere activity, thus increasing carbon fixation and nutrient uptake while suppressing plant diseases.** The result of these effects was an increase in gross income of $68.64/acre.
Farmer: Mike Humphrey  
Location: Twin Falls, Idaho  
Variety: Small red beans

Soil type: good quality, with 25% low-productivity “white” soils; Portneuf silt loam

Planting date: June 19, 2000

Experimental design: A field of small red beans was treated conventionally except for a strip through the center of the field that received Vitazyme.

1. Control  
2. Vitazyme

Fertilization: unknown

Vitazyme application: The seeds were treated with a 5% Vitazyme solution before planting, plus 13 oz/acre sprayed on the soil after planting, and another 13 oz/acre sprayed on the leaves and soil at early bloom.

Harvest date: unknown

Yield results: Two 2.5-acre strips in the Vitazyme strip were harvested and weighed, and compared to the untreated control yield, from which 18 acres was combined and weighed.

Income increase: $36.90/acre

Conclusions: Vitazyme applied on the seeds of these red beans before planting, as well as twice on the soil and leaves during the growing season, increased bean yield by 10% and increased income by $36.90/acre. This improvement amounted to a return on investment of 3.7:1.
2000 Crop Results

Vitazyme on Field Beans (Organic)

Farmer: Richard and Eric Parrott, Parrott Organic Farms
Location: Twin Falls, Idaho

Variety: Great Northern beans
Planting date: June 15, 2000

Soil type and conditions: light to white in color, and a moderate slope; 40% are white, which are areas of poor yield; Portneuf silt loam
Previous crop: field beans

Experimental design: A fairly uniform 20-acre field was divided into control (8 acres) and Vitazyme treated (12 acres) areas. Soils in both areas were relatively equivalent, with 40% white soils in each area.

1. Control
2. Vitazyme

Fertilization: beef manure compost with crop residues

Irrigation: furrow irrigation of limited quantity

Vitazyme treatment: a 5% Vitazyme solution on the seeds before planting, and 12 oz/acre sprayed on the plants and soil at pre-bloom

Harvest date: September 25, 2000

Yield results:

* A value of $0.35/lb was received. Actual yield values for the two treatments have been kept confidential by the grower.

Conclusions: Two applications of Vitazyme to this Great Northern field bean crop produced a sizeable yield increase of higher quality beans, that translated into $106.58/acre more income. Such an increase produced a 21:1 income increase: product cost ratio. The yield improvement was due in part to better germination and growth on the poor “white” soil of this field, but also due to improved growth throughout the field on all soils.
**2000 Crop Results**

**Vitazyme on Navy Beans (Organic)**

**Farmer:** Leon Roske  
**Location:** Olivia, Minnesota  
**Variety:** Schooner  
**Row spacing:** 30 inches  
**Soil type:** Clarion-Nicollet-Webster silty clay loam  
**Planting date:** June 25, 2000

**Experimental design:** A field of Navy beans was treated with Vitazyme except for a strip that received none.

1. **Control**  
2. **Vitazyme**

**Fertilization:** fish emulsion and molasses on the seeds at planting, and again on the leaves and soil at early bloom (see below)

**Vitazyme treatment:** At planting, Vitazyme (13 oz/acre) plus molasses (0.5 gal/acre) and liquid fish (2 gal/acre) were applied. At early bloom (late July) Vitazyme was again applied at 13 oz/acre, along with 0.5 gal/acre liquid fish, on the leaves and soil. This late application was made to both the control and Vitazyme treatments.

**Weed control:** cultivation, plus hand weeding midsummer

**Harvest date:** September 21, 2000

**Yield results:** Yield checks were made in the check strip, and on either side in the treated areas. These yields were weighed at a local grain elevator.

<td>2,132 (+411 (+24%)</td>
</tr>
</tbody>
</table>

* Only the north treated side is included here since the south strip had a low area that reduced yield by 67 lb/acre.

**Bean yield increase**: 24%

* The increase may have been greater had the control not been given the second Vitazyme application.

**Income results:** A value of $0.30/lb for organically grown Navy beans is expected.

<table>

<th>Vitazyme</th>
<th>Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bean value</td>
<td>516.30</td>
<td>639.60 (+123.30)</td>
</tr>
</tbody>
</table>

**Income increase:**

**$123.30/acre**

**Conclusions:** Vitazyme applied to these Navy beans grown in Southern Minnesota provided a substantial yield increase (+24%), as well as a large increase in income ($123.30/acre). The yield and income increases may have been greater had the control strip not received the benefit of the second Vitazyme application. A serious dry period late in the growing season and a late planting reduced the yield potential somewhat, but even so a good yield was obtained.

Vitazyme on Black Turtle Beans

**Researcher:** Lewis Bickle, Bickle Farm  
**Location:** Dansville, New York  
**Planting date:** June 5, 1999

**Variety:** black turtle soup beans  
**Row spacing:** 30 inches  
**Harvest date:** October 23

**Experimental design:** A level, uniform field was divided into four strips (about 10 acres each), treated with different products, one of which was Vitazyme. An untreated control was also maintained.

1. **Control** (no Vitazyme)  
2. **Vitazyme**

**Fertilizer treatments:** 200 lb/acre KCl broadcast preplant; 350 lb/acre 7-28-9 at planting

**Vitazyme application:** Vitazyme at 13 oz/acre was sprayed over the leaves and soil just before blossom on July 21, 1999.

**Yield results:**

<table>

</tr>
</thead>
<tbody>
<tr>
<td>Bean yield, bu/acre</td>
<td>32.5*</td>
<td>46.5</td>
<td>14.0 (+43%)</td>
</tr>
</tbody>
</table>

*Liberal yield estimate by the farmer.

**Bean Yield, bu/acre**

Yield increase: 43%

**Income increase:** Bean value: $9.00/bu ($0.15/lb)

**Income increase:** $126.00/acre

**Comments:** The Vitazyme treated beans were larger than those of the control. There was more white mold with the Vitazyme treatment.
